```
The present invention relates to compositions for inhibiting influenza infection and/or replication. The compositions comprise a short interfering RNA (SiRNA) targeted to a target transcript, which is an agent specific transcript involved in infection by or replication of influenza A or B virus. The target transcript

The invention comprises a method of preparing amplified RNA (aRNA)

Sequences present in one or more target polymuclectide that is single
stranded crm made single stranded. The method involves forming double
stranded cDNA templates containing sequences present in the target

CC polymuclectide and transcribtion to the propertion of produce
cC amplified RNA containing sequences of the target polymuclectide. The

CC amplified RNA containing sugernic so it the target polymuclectide. The

CC amplified RNA containing sugernic so it the population of RNAs

CC capable of the invention is useful for amplifying the population of RNAs

CC extracted from formalin-fixed tissues and/or the population of RNAs

CC capable of the invention is useful for determining gene

CC expression in neuronal and non-neuronal cells involved in disorders of

CC the nervous system, such as: neurodegenerative diseases (e.g. Parkinson's

CC disease, Alzheimer's disease, and multiple sclerosis); psychiatric

CC disorders (e.g. schizophrenia); and affective disorders (e.g. manic

CC depression, lack of appetite control, and attention deficit disorder).

CC The method of the invention may also be used to detect cancer cells, and

CC decilitate diagnosis/prognosis of cancer in a patient. The present DNA

CC sequence is shown in a figure exemplifying the method of the invention. ö New composition comprising an siRNA or shRNA targeted to an agent-specific transcript, useful for treating or preventing influenza virus replication, pathogenicity or infectivity. The invention relates to a method of suppressing a symptom of an allergic response in a subject by administering a first and second dose of an immunostimulatory nucleic acid that comprises a nucleotide sequence comprising 5'-ga', and where the second dose is administered from 1 day to 8 weeks after the first dose. The methods and compositions of the present invention are useful for the treatment or prevention of asthma and allergy, including rhinitis, uricaria and atopic dermatitis, using an immunostimulatory nucleic acid alone or in combination with other medicaments. They can also be used in preventing bacterial and viral infections. This sequence represents an oligonucleotide used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Suppressing allergies, including aethma, rhinitis, urticaria and atopic dermatitis, in a subject, comprises administering a first and second dos of an immunostimulatory nucleic acid.
              protein 1, membrane protein 2, nonstructural protein 1, nonstructural protein 2, polymerase protein PB1, polymerase protein PB2, polymerase protein PA or polymerase protein NP. The composition is useful for treating or preventing influenza virus replication, pathogenicity or infectivity. The present sequence is a PCR primer used during siRNA

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    vector and a recombinant vaccine composition against poliovirus, which may induce the formation of neutralizing antibodies against Sabin types 1, 2 and 3 polioviruses, and prevent the side-effects of OPV (attendated oral polio vaccine, Sabin). The present sequence is that of a PCR primer which was used during the development of the novel recombinant Sabin type 1 poliovirus vector of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Poly (dT)12-18 oligo, SEQ ID NO:150, used in first strand cDNA synthesis.
Novel recombinant Sabin type 1 poliovirus vector-related PCR primer #13.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This invention relates to a novel recombinant Sabin type 1 poliovirus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

Wissenbach M; Petersen KD, Westergaard M,

WPI; 2005-056301/06.

Novel compound useful for modulating expression of gene involved in cancer disease, or for modulating red blood cell proliferation, cellular proliferation, ion metabolism or glucose and energy metabolism.

Example 6; SEQ ID NO 150; 92pp; English.

peruchoises Selected in the 3-metropyraphracil, 6-aminopurine, 2aminopurine, inosine, diaminopurine and 2-chloro-6-aminopurine. The
invention also relates to a conjugate comprising a TRX antisense
coligonuclectide of the invention and one or more non-nuclectide or nonplarmaceutical composition comprising a TRX antisense oligonuclectide, and a
plarmaceutical composition comprising a TRX antisense oligonuclectide or
conjugate of the invention, optionally further comprising a
chemotherapeutic agent, an antiinflammatory compound or an antiviral
compound. The TRX antisense oligonuclectides, and conjugates and
compositions containing them, are useful in the treatment of cancers such
as carcinoma, breast carcinoma, are useful in the treatment of cancers such
as carcinoma, breast carcinoma, recurrent superficial bladder cancer,
carcinoma, bladder carcinoma, recurrent superficial bladder cancer,
stomach carcinoma, prostatic carcinoma, pancreatic carcinoma, lung
carcinoma, cervical carcinoma, colorectal carcinoma and carcinoid
tumors); sarcomas (e.g., osteosarcoma, Eshigs sarcoma, chondrosarcoma,
malignant fibrous histiccytoma, fibrosarcoma, and Kaposi's sarcoma;
creationant of the TRX antisense oligonuclectides are also useful in the
creationant of conditions such as atheroselerosis psoriasis, diabetic
creationant of conditions such as atheroselerosis psoriasis, diabetic
creationant of conditions such as atheroselerosis psoriasis, diabetic
creationant of conditions and as thereseleroselerome, and allarents. The invention relates to antisense oligonucleotides consisting of 8-50 nucleotides and/or nucleotide analogs which inhibit expression of the putative human oncogene thioredoxin (TRX). The antisense oligonucleotides comprise a subsequence of 8 or more nucleotides or nucleotide analogs, wherein the subsequence is located within a sequence selected from ADV11669-ADV11724. The oligonucleotides preferably contain at least nucleotide analog, especially a locked nucleic acid (INA) or a modified nucleobase selected from 5-methylcytosine, isocytosine, retinopathy, theumatoid arthritis, asthma, warts, and allergic dermatitis. They may additionally be used for inhibiting cellular proliferation and for modulating red blood cell proliferation, ion metabolism, glucose and energy metabolism, pH regulation, matrix metabolism, apoptosis, cytokinesis or the cell cycle. The TRX antisense oligonuclectides of the invention have increased specificity and affinity for TRX mRNA, and are resistant to degradation. The present sequence represents a poly (dT)12-18 oligonuclectide used in first strand synthesis of human thioredoxin cDNA in an example of the invention.

New oligomeric compound for the modulation of survivin, useful for treating e.g. cancers, atherosclerosis, psoriasis, diabetic retinopathy, rheumatoid arthritis, asthma, warts, or allergic dermatitis. WPI; 2005-100663/11.

Example 6; SEQ ID NO 741; 264pp; English.

The invention relates to antisense oligomucleotides consisting of 8-50 mucleotides and/or nucleotide analogs which inhibit expression of human survivin, an inhibitor of apoptosis which is also essential for cell division and angiogenesis. The antisense oligomucleotides comprise a subsequence of 8 or more nucleotides or nucleotide analogs, wherein the subsequence of 8 or more nucleotides or nucleotides analogs, wherein the subsequence is located within a sequence selected from ADW0944-ADW09586. The oligomucleotides preferably contain a linkage group selected from a phosphate group, a phosphorothioate group or a boranophosphate group. The invention also crelates to a conjugate comprising a survivin antisense oligomucleotide of the invention and one or more non-nucleotide or non-polymucleotide of composition comprising a survivin antisense oligomucleotide, and a pharmaceutical composition comprising a survivin antisense oligomucleotide or conjugate of the invention, optionally further comprising a chemotherapeutic agent. The survivin antisense oligomucleotides, and conjugates and compositions correlating them, are useful in the treatment of cancers such as carcinoma, breast carcinoma, non-small cell lung cancer, renal cell carcinoma, bladder carcinoma, non-small cell lung cancer, renal cell carcinoma, prostatic carcinoma, prostatic carcinoma, prostatic carcinoma, cervical carcinoma, prostatic carcinoma, and kaposi's sarcoma (e.g., carcinoma, prostatic carcinoma, prostatic carcinoma, and kaposi's sarcoma (e.g., carcinoma, prostatic arcinoma, and kaposi's sarcoma, cumpanian properment of conditions such as atherosclerosis, psoriasis, diabetic certinopathy, rheumatoid arthritis, asthma, warts, and allergic certinoma proprieting apoptorial and personal edicenting and proliferation, for modulating apoptosis and for treating a disease related to abnormal angiogenesis. The survivin antisense oligonucleotides of the invention are shorter than prior art survivin antisense ö

The invention relates to a polynucleotide (I) for synthesizing labeled protein and having ability to increase labeling efficiency of labeling compound, where protein is produced by adding labeling compound to 3, terminal of sequence encoding target protein of gene template, where labeling compound has label portion and acceptor portion having compound capable of binding to C-terminus of label portion and translating gene template in presence of labeled compound. (I) is useful for producing a labeling protein, which involves preparing a gene template by adding (I) to the 3'-terminal of base sequence encoding the target protein, translating the gene template in the presence of the labeling compound containing acceptor portion and label portion, and obtaining protein synthesized in the translation system. The base sequence encoding the target protein either contains the termination codon or does not contain the termination codon. The labeling compound is added after the initiation of the translation. The labeled protein (LPI) is useful in a performance-analysis of a protein, which involves contacting the test substance with (LPI), and analyzing the interaction between the protein and the test substance. (I) has the ability to increase labeling efficiency of a labeling compound and thus effectively produces labeled protein. This sequence corresponds to a sequence used in the method of
                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Novel polynucleotide having ability to increase labeling efficiency of labeling compound, useful for synthesizing labeled protein in presence of labeling compound.
                                                                                                                                                                                              Gaps
oligonucleotides (16-mers compared to 20-25-mers), therefore having increased specificity and affinity for survivin mRNA, and also have higher biostability and cell permeability. The present sequence represents a poly (dT)12-18 oligonucleotide used in first strand synthesis of human survivin cDNA in an example of the invention.
                                                                                                                                                                                              ö

```
The invention relates to a polynucleotide (I) for synthesizing labeled protein and having ability to increase labeling efficiency of labeling compound, where protein is produced by adding labeling compound to 3, cemplate of sequence encoding target protein of gene template, where labeling compound has label portion and acceptor portion having compound capable of binding to C-terminus of label portion and translating gene template in presence of labeled compound. (I) is useful for producing a labeling protein, which involves preparing a gene template in presence of labeled compound. (I) is useful for producing to the 3'-terminal of base sequence encoding the target protein, translating the gene template in the presence of the labeling compound containing acceptor portion and label portion, and obtaining protein synthesized in the translation system. The base sequence encoding the target protein either contains the termination codon or does not contain the termination codon. The labeling compound is added after the initiation of the translation. The labeled protein (LPI) is useful in a containing compound is added after the initiation of the translation. The labeled protein (LPI) is useful in a performance-analysis of a protein, which involves contacting the test cubstance with (LPI), and analyzing the interaction between the protein and the test substance with (LPI), and the shilty to increase labeling
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Novel polynucleotide having ability to increase labeling efficiency of labeling compound, useful for synthesizing labeled protein in presence of labeling compound.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            efficiency of a labeling compound and thus effectively produces labeled protein. This sequence corresponds to a sequence used in the method of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   0.7%; Score 18; DB 1; Length 18; 100.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      receptor protein referred as VSHK-1 useful for diagnosing or treating cancer. The invention also relates to a method for reducing the growth of a cancerous cell. VSHK-1 is useful for identifying a VSHK-1 receptor ligand and to identify a substance which modulates its signal transduction activity. The HX2004-6 DNA is useful to detect the presence of HX2004-6 in a biological sample (e.g. ductal epithelial cells from tissue chosen from pancreas, colon and breast). The invention is useful for screening drugs for the treatment of cancer. The present sequence is a reverse transcriptase (RT)-PCR primer used in the expression analysis
                                                                                                                                                                                                                                                        diagnosis; therapeutic; cancer; cytostatic; neoplasm; ss; transcriptase PCR; primer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to human HX2004-6 protein and a seven transmembrane
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New isolated human HX2004-6 polypeptide or isolated VSHK-1 polypeptide, useful for diagnosing or treating cancer, where VSHK-1 is also used to identify a VSHK-1 receptor ligand.

The method is useful for screening, diagnosing and treating a subject for cardiac, renal or inflammatory disease. The present sequence is an oligonuclectide used to identify differentially expressed rat P00188_D12 clone secreted factor gene.
                                                                                                                                                                                                                                                                                                                                                                               Screening subject for cardiac, renal or inflammatory disease caused by differential expression of polypeptide (new secreted factor) or its endogenous homologue, by measuring and determining expression of

The present invention provides compositions and methods for the detection of a target polynuclectide. A claimed probe set comprises: (a) a donor polymer comprising (i) a first polynuclectide binding domain complementary to a first region of a target polynuclectide flanked by first and second stem regions which hybridize in the absence of the target polynuclectide form a stem-loop or random-coil structure, and (ii) a quantum dot; and (b) an acceptor polymer comprising (i) a second plynuclectide binding domain complementary to a second region of the polynuclectide flanked by first and second stem regions which the absence of the target polynuclectide flanked by first and second stem regions which hybridize in the absence of the target polynuclectide to form a stem-loop or random-coil structure, and (ii) at least one reporter. Energy transfer occurs between the donor and the reporter(s) when the donor polymer and the reporter(s) when the donor polymer the acceptor polymer hybridize to the target polynuclectide and the cquantum dot is exposed to an exciting amount of energy. The polymers may further comprise a protein transduction domain and/or targeting signal. Preferably, at least one polymer comprises a peptide nucleic acid, a comprising a danor probe and acceptor probe. A claimed method of detecting a target polynuclectide comprises delivering at least one probe and acceptor probe. A claimed method of detecting a target polynuclectide comprises delivering at least one probe and acceptor probe hybridize to the target polynuclectide. The detectable signal is an energy polynuclectide is comprised between the quantum dot and the reporter to produce a point the target polynuclectide. The detectable signal is an energy polynuclectide or materion, deletion or insertion in the target polynuclectide, or of a certain agent polynuclectide. The detectable signal is an energet polynuclectide or method for an excit method for a certaing cells expressing a target nucleic acid, a method for sorting cells expressing a target nu
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New activable probe set comprising a donor polymer and an acceptor polymer, useful for in vivo gene detection or for detecting a target polynucleotide.

The method comprises administrating an immunostimulatory nucleic acid (I) to induce Th1-like immune activation; and administrating a cyclooxygenase inhibitor (II) to inhibit prostaglandin expression, is new. The present sequence is one such immunostimulatory nucleic acid. (I) is useful for treating nonallergic inflammatory diseases such as psoriatis, inflammatory bowel diseases (Crohn's disease and ulcerative colitis), eczema, allergic

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                absence of a single target molecule or target analyte (e.g. nucleic acid, protein, lipid, bacterium). The method involves contacting sample with one or more types of nanoparticle having target binding complements and detecting any light scattering complex formed. The nanoparticle probe complexes comprise two or more probes bound to a specific target analyte. The present sequence is a T20 diluent which is used in the preparation of a shown on page 21 in example 17 of the specification. This sequence differs from the SEQ ID NO: 26 shown on page 21 in example 17 of the specification. This sequence in page 25 of the specification (see ABD67955).
                                                                                                                                                                                                                                                                                                                                                                                                                           Detecting target (e.g. nucleic acid, protein, lipid, bacterium) in sample, comprises contacting sample with one or more types of nanoparticle having target binding complements, and detecting any light scattering complex formed.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention provides a method for detecting the presence or

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to a diagnosis reagent and method for detecting the early phase of tumors, prognosis and monitoring by using peripheral blood, body fluid or tissue as specimen. The method involves measuring the survivin transcripton level, using the expression amount of survivin as the standard. The reagent comprises the following components, survivin nucleic acid fragment coated on the carrier, preparing RNA and cDNA from the specimen, PCR amplification of the survivin from prepared cDNA. This sequence represents a reverse transcriptase (RT)-PCR primer used in the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of abblied reverse transcription primers (GENESEQ files AAQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                                                                 The invention relates to one kind of ARF1 gene in cotton genome and its promoter sequence. The gene and the promoter may be preponderantly expressed in the bud, flower, fiber and boll shell. The gene and the promoter may be useful in the research of the development of cotton reproductive organ, the quality improvement and the specific expression of foreign gene in cotton reproductive organ. The present sequence represents a cotton ARF1 related PCR primer.
                                                                                                                                                                                                                                                                                      Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of abelled reverse transcription primers (GENESEQ files AAQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily

The present invention describes a method for describing a nucleic acid probe, which comprises using chain extending enzymes to elongate probes. The method comprises: (a) treating the sample with a chain terminating caegant to prevent polynucleotide chain growth from the nucleic acid in the sample; (b) contacting the sample with the probe containing a terminus capable of elongation by a chain extending enzyme, where the complex to the nucleic acid in the sample; (c) contacting the sample with a chain extending enzyme and its substrates, which elongates the probe; and (d) detecting the alongated hybridised probe. Also cample with a chain extending the alongated hybridised probe. Also described is a method comprising: (a) treating nucleic acid molecules or modified nucleic acid chains unextendable by a non-template-dependent enzyme; (b) hybridising the treated molecules with a nucleic acid probe that includes an extendable terminus, under conditions where hybrids form; and (c) treating any hybrids formed with a non-template dependent chain elongating enzyme and its substrates, where any hybridised probe is elongating enzyme and its substrates, where any hybridised probe is acide, particularly DNA hybridisation probes. The present sequence represents a tailing reaction exemplary primer, which is used in an example from the present invention
                                                                Identifying and detecting nucleic acids, particularly DNA hybridization probes, involves employing chain extending enzymes (e.g. telomerase) to elongate probes to render them readily detectable.
                                                                                                                                                                                                  The present invention describes a method for detecting a nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Nuclease resistant; ds; pharmaceutical; topical administration; transdermal patch; enzymatic degradation resistant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          0.7%; Score 18; DB 1; Length 19; 100.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                   A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of labelled reverse transcription primers (GENESEQ files AACS547-C57598) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                                                                                                                                                                                                                                                                        Analysis of cDNA and gene expression - by amplification of mRNA followed
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to the isolation of nucleic acid molecules comprising fragments of a cytochrome P450 gene from Nicotiana plants or molecule that have at least 75, 91 or 99% identity to the sequences. The nucleic acid molecules are useful for altering plant phenotypes, and for producing transgenic plants containing high nornicotine levels. This sequence represents a PCR primer used to isolate the fragments of the genes of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New isolated nucleic acid molecule comprising a fragment of cytochrome P450, useful for altering plant phenotypes, and for producing transgenic plants containing high nornicotine levels.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                cytochrome P450 gene; tobacco; phenotype; transgenic plant; nornicotine;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

The invention relates to an isolated nucleic acid molecule (I), comprising a nucleic acid sequence chosen from 75 Nicotiana-derived cytochrome P450 enzyme fragment sequences. (I) is useful for producing a transgenic tobacco plant, which involves operably linking (I) with a promoter functional in the plant to create a plant transformation vector, and transforming the plant with the plant transformation vector, and transforming the plant with the plant transformation vector, selecting a plant cell transformed with the transformation vector, are resenctating a plant from the selected plant cell. The nucleic acid molecule is in an antisense orientation, sense orientation or is in a RNA interference orientation. The present sequence represents a PCR primer used to clone DNA encoding tobacco cytochrome P450 enzyme fragments of
                                                                                                                                                                                                                                                                                                                                                                                                                                    An isolated nucleic acid molecule, comprising nucleic acid sequence of Nicotiana derived cytochrome P450 enzyme fragments, useful for producing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    amplified RNA preparation; nervous system disorder;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention describes an oligonucleotide comprising several nucleotides covalently linked together by internucleotide linkages. At least one of the nucleotides is linked to an adjacent nucleotide by 2'.5'.

The nucleotide sinkage and bears a 3'-substituent. The oligonucleotides internucleotide linkage and bears a 3'-substituent. The oligonucleotides are useful: as antisense oligonucleotides; in pharmaceutical compositions of protein e.g. organism that utilises RNA-DNA transcription or RNA-protein to protein e.g. organism that utilises RNA-DNA transcription or RNA-protein translation, bacteria, yeast, protozoa, algae and warm-blooded animals; con developing diagnostic and therapeutic agents. The modified coligonucleotide exhibits improved properties of nuclease resistance and coligonucleotide is potent antisense agent with longer cucleic acids. The oligonucleotide is potent antisense agent with longer duration.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New oligonucleotide comprising at least one 2',5'-internucleotide linkage useful for treating organisms having disease caused by undesired

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         셤
                                                                                                                                                                                                                                                                 The invention comprises a method of preparing amplified RNA (aRNA)

sequences present in one or more target polynucleotide that is single
stranded or made single stranded. The method involves forming double
stranded or made single stranded. The method involves forming double
stranded cDNA templates containing sequences present in the target
copple of initiating transcription via the promoter region to produce
amplified RNA containing sequences of the target polynucleotide. The
method of the invention is useful for amplifying the population of RNAs
contained formal inflating sequences of the target polynucleotide. The
stracted from formallin-fixed tissues and/or the population of RNAA
splice variants. The method is also useful for determining gene
captession in neuronal and non-neuronal cells involved in disorders of
the nervous system, such as: neurodegenerative diseases (e.g. Parkinson's
disorders (e.g. schizophrenia); and multiple sclerosis); psychiatric
cdisorders (e.g. schizophrenia); and affective disorders (e.g. manic
cdepression, lack of appetite control, and attention deficit disorder).
The method of the invention may also be used to detect cancer cells, and
copilitate diagnosis/prognosis of cancer in a patient. The present DNA

The invention provides nucleic acid reporters and methods of their use.

The nucleic acid reporters include molecular beacons modified with protein transduction domains (PTDS) to facilitate translocation of the nucleic acid reporter across cellular membranes. The nucleic acid reporter across cellular membranes. The nucleic acid reporter to a specific cell, tissue, organ, citracallular region, organelle or vesicle. The molecular beacon can be used in methods for: detecting or sorting cells expressing a target nucleic acid, in a living cell; identifying modulators of gene expression; determining the effectiveness of an agent on a host cell; and detecting the transport and localization of a nucleic acid, in a living cells expressed on a specific cell; and detecting the transport and localization of a nucleic acid in a living cells; identifying colls acid-protein complex in living cells. The present sequence is of a polyh probe. This was used as a negative control in a fluorescence in situ hybridization (Fish) assay targeting GAPDH mRNA in a comparison of this traditional method of detection with the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö

nucleic acid molecule, a method of increasing or decreasing nornicotine levels in a plant by operably linking the nucleic acid molecule with a promoter functional in the plant, a tobacco product having reduced amounts of nornicotine levels, the tobacco product comprising tobacco from the plant, a tobacco leaf having reduced amounts of nornicotine levels and a method of isolating a gene from a plant using the isolated nucleic acid. In producing a transgenic plant, the plant has reduced levels of nornicotine. The tobacco product is selected from cigarettes, cigars, pipe tobacco, snuff, chewing tobacco, products blended with the tobacco product and their mixtures. The nucleic acid molecule is useful for altering plant phenotypes, thus producing a transgenic plant having reduced levels of nornicotine. This sequence represents a PCR primer used to amplify CDNA encoding a tobacco cytochrome P450 enzyme of the Score 18; DB 1; Length 19; Pred. No. 8.9e+02; 0; Indels Oligonucleotide used for modulating gene transcription. AED1 ò 원 ö The invention relates to an isolated nucleic acid molecule (I) from Nicotiana, where the nucleic acid molecule comprising any of the 59 nucleic acid sequences of SEQ ID NOS: 299-357 (NOTE:The claims refer to SEQ ID NOS 299-357 as nucleic acids but these sequences (apart from SEQ ID NO 356) are all proteins and appear as ADZ65402-ADZ65460. The nucleic acids of the invention encode cytochrome p450 enzymes whose expression is induced by ethylene and/or plant senescence. Also included are a transgenic plant comprising (I), a method of producing a transgenic plant, a method of selecting a plant containing a nucleic acid molecule where the plant is analyzed for the presence of nucleic acid sequence of Nicoliana, encoding a protein. The invention also relates to a transgenic plant comprising the nucleic acid molecule, a method of producing a transgenic plant comprising operably linking the nucleic acid molecule with a promoter functional in the plant to create a plant transformational vector, transforming the plant with the plant transformational vector, selecting a plant cell transformed with the transformation vector and regenerating a transformation plant from the transformation vector and regenerating a transformation plant from the transformed plant cell, a method of selecting a plant containing a New isolated nucleic acid molecule from Nicotiana, useful for altering plant phenotypes, thus producing a transgenic plant having reduced levels Gaps .; 0 invention relates to an isolated nucleic acid molecule from useful in developing tobacco plants with altered phenotypes. The invention relates to a nucleic acid molecule or its complement sequence capable of modulating transcription. The nucleic acid molecule of the invention is useful for transcription of polynucleotides in a host cell or transformed host organism. The present sequence is an oligonucleotide used for modulating gene transcription. New isolated nucleic acid molecule capable of modulating transcription, or its complement, useful for transcription of polynucleotides in a host

The invention relates to an isolated nucleic acid molecule capable of modulating transcription, where the nucleic acid molecule shows at least combulating transcription, where the nucleic acid molecule shows at least specification or its complement. The invention also relates to a vector construct comprising a first nucleic acid capable of modulating transcription, where the nucleic acid molecule shows at least 80% transcription, where the nucleic acid molecules are heterothy to one of the promoter sequences given in the sequence identity to one of the promoter sequences given in the specification, and a second nucleic acid molecules are heterologous to each other and are operably linked together, a host cell comprising the nucleic acid molecule is flanked by an exogenous concerning the comprising the vector construct. The first comprising the vector construct. The first comprising the vector construct. The first comprision the vector construct. The first comprision in the specification, where the plant cell is regenerated concours in the specification, where the plant cell is regenerated into a plant. The nucleic acid molecules, which are promoter sequences, cor comprision in the specification, where the plant cell is regenerated into a plant. The nucleic acid molecules, which are promoter sequences, and promoter control elements are useful for modulating transcription of a desired polymucleotide in plantes. This sequence represents a synthetic continue to the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New isolated promoter sequences and promoter control elements, useful for modulating transcription of a desired polynucleotide in plants.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Score 18; DB 1; Length 19;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention relates to polynucleotides and their encoding polypeptides with the use of those products for making transgenic plants. The sequences of the invention are useful modifying plant characteristics or for modulating and manipulating growth, development and blochemistry of a plant. The invention is useful for producing plants with increased reproducible raw materials. The present sequence is a d(T)18 primer used to generate probes for hybridization. This sequence is used in making
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New nucleotide sequences, useful modifying plant characteristics or for modulating and manipulating growth, development, and biochemistry of a

CDNAs of the invention. 

Degenerate PCR primer for cloning cytochrome p450 cDNA, SEQ ID NO: 2260.

Sequence 19 BP; 0 A; 0 C; 0 G; 18 T; 0 U; 1 Other;

S

Plant breeding; plant; 8s; PCR; transgenic plant; senescence; primer.

Synthetic.

demethylase gene comprises crossing a first tobacco plant with a second tobacco plant and germinating the collected seed of an Fl progeny plant Producing a tobacco plant having decreased expression of a nicotine

Disclosure; SEQ ID NO 2260; 641pp; English.

The invention relates to a breeding method for producing a tobacco plant with reduced expression of a nicotine demethylase gene expression af first tobacco plant with at least one phenotypic trait to produce a first tobacco plant with at least one phenotypic trait to produce a first tobacco plant with at least one phenotypic trait to produce a tobacco plant having reduced expression of a nicotine demethylase deficiency trait into a tobacco plant, producing a tobacco seed, deficiency trait into a tobacco plant, producing a tobacco plant in a tobacco beained from the tobacco plant conting a modified attribute, a method for the invention, producing a tobacco plant avoing a modified attribute, a method of preeding an attribute into a tobacco plant, producing a tobacco plant paying a modified attribute of method of preeding an attribute into a tobacco plant producing a tobacco plant producing a tobacco plant producing a tobacco plant producing a modified attribute or developing a tobacco plant baving a modified attribute or developing a tobacco plant baving a modified attribute or developing a tobacco plant baving a modified attribute or developing a tobacco plant baving a modified attribute or developing a tobacco plant baving a modified attribute or developing a tobacco plant baving a modified attribute or developing a tobacco plant baving a modified attribute or developing a tobacco plant baving a modified attribute or developing a tobacco plant baving a modified attribute or developing a tobacco plant baving a modified attribute or sequence given in the specification (the nucleic acids comprise isolated corrected by the modified attribute or senescence induced from a germinated seed of the plant, reducing substantially identical to a michigan or enzymatic activity of a constitutive, or an ethylene or senescence induced tobacco polypeptide in a plant cell, the expression or enzymatic activity of a constitutive, or an ethylene or senescence induced tobacco polypeptide in a plant produced to senescence induced toba

Arabidopsis thaliana and the polypeptides encoded by them. The patentees also claim a vector construct containing such nucleic acid molecules, and a laso claim a vector construct containing such nucleic acid molecules, and a host cell transformed; a method for detecting a nucleic acid in a sample; and a plant, plant cell, plant material or seed of a plant which comprises the nucleic acid molecule which is exogenous or heterologous to the plant or plant cell. The vector construct comprises a first nucleic acid having a regulatory sequence capable of causing transcription and/or translation in a plant and a second nucleic acid having the sequence of the isolated nucleic acid molecule. The first and second nucleic acids are operably linked and where the second nucleic acid is heterologous to any element in the vector construct. The isolated nucleic acid molecules are useful in producing transgenic plantes for use as models for modifying plant characteristics, e.g. increase in plant height, number or size of leaves, or wood products. The present sequence is that of a primer used in generation of labeled probes from first-stand cDNA.

                                                                                                                                                                                                                                                                                                                                                                                           χα D,
```

The invention relates to a breeding method for producing a tobacco plant having decreased expression of a nicotine demethylase gene. The method involves crossing a first tobacco plant having variant nicotine demethylase gene expression with a second tobacco plant containing at least one phenotypic trait (e.g., disease resistance, high yield etc.) to produce an Pl progeny plant; collecting the seed of the Pl progeny; and germinating the seed to produce a tobacco plant having decreased nicotine demethylase expression. The invention also relates to a tobacco plant or its components produced using the method of the invention; a tobacco product produced using the method of the invention; a tobacco product produced from such plants; and a method of breeding a tobacco product produced from such plants; and a method of breeding a tobacco product produced from such plants; and a method of breeding a tobacco product produced from such plants; and a method of breeding a tobacco product produced expression of a plant with a modified attribute comprising variant expression of a cytochrome P450 polynucleotide (including the nicotine demethylase gene). The invention further relates to isolated constitutive, ethylene-induced or senescence-induced genetic markers comprising tobacco cytochrome P450 concleded increasing the expression or activity of polypeptides for reducing or increasing the expression or activity of polypeptides encoded by these nucleic acid molecules; expression vectors, plants or

plant components comprising one of these polynucleotides; and tobacco products produced from such plants. The methods of the invention are useful for the breeding) (especially marker sesisted breeding) of tobacco cytochrome P450 expression or activity. Altered expression or with altered cytochrome P450 expression or activity. Altered expression of such a crange in the composition of secondary cytochrome P450 expression or activity. Altered expression of such cytochrome P450 expression or activity. Altered expression of such cytochrome P450 expression or activity. Altered expression of such cytochrome P450 expression or activity. Altered expression of such cytochrome the flavor or aroma of plant products. They may also affect cytochrome the flavor or aroma of plant products. They may also affect herbicide tolerance, resistance to disease or insects, quality factors correlated to undesirable constituents, structural traits, disher content. The invention in which the expression of extochrome P450 genes is of the invention in which the expression of extochrome P450 genes is caltered may have desirable traits such as altered levels of nornicotine or N-nitrosonornicotine. Such plants can be used in the production of tobacco products such as moist or dry snuff, chewing tobacco, cigarettes, cigarillas, pipe tobacco, bidis or smokeless tobacco products controlled to activity of tobacco cytochrome P450 charactivity from the US patent is expression of controlled to also available in electronic format directly from the US patent of fice at also available in electronic format directly from the US patent tief controlled to also available to the format directly from the US patent of fice at segdata.uspto.gov/seguence.html?DocID=20060041949 %XGGGGGGGGGGGGGGGGGGGGGG

Analysis of cDNA and gene expression - by amplification of mRNA followed by digestion with restriction enzymes.

Disclosure; Page 5; 11pp; Japanese.

븅탕 A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of labelled reverse transcription primers (GENESEQ files AAQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily

                                                                                                                                                                                                                                                                                                                                                                                                                                                          A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of abelled reverse transcription primers (GENESEQ files AAQ75547.075798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of CDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily

A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of labelled reverse transcription primers (GENESEQ files AAQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                                                                                                                                                                                       Analysis of cDNA and gene expression - by amplification of mRNA followed
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Analysis of cDNA and gene expression - by amplification of mRNA followed by digestion with restriction enzymes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Analysis; gene expression; reverse transcription; primer; cDNA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Reverse transcription primer used in cDNA analysis technique.

```
A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of labelled reverse transcription primers (GENESEQ files AAQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in separate The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           method can be used to analyse gene expression rapidly and easily
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Analysis, gene expression, reverse transcription; primer; cDNA; aggregate; restriction enzyme; ss.

New antisense compound targeted to a nucleic acid molecule encoding mammalian glucocorticoid receptor, useful for treating diabetes, obesity, cardiovascular disorder, hyperlipidemia or Cushing's syndrome.

Claim 4; SEQ ID NO 4182; 985pp; English.

The invention comprises an antisense oligonucleotides that are targeted to nucleic acids encoding a mammalian glucocorticoid receptor. The antisense oligonucleotides of the invention are useful for preventing or delaying infection, inflammation or tumour formation. The antisense

The antisense oligonucleotides of the invention are useful for preventing or alelaying infection, inflammation or tumour formation. The antisense oligonucleotides are also useful for treating diabetes, obesity, cardiovascular disorders, hyperlipidaemia or Cushing's syndrome. The present DNA sequence represents an antisense oligonucleotide that targets the numan glucocorticoid receptor gene. NOTE: The present sequence that cardiovascular section and section of the present sequence contains 2'-methoxyethyl (2'-MOE) wings and a phosphorothioate backbone.
                                                                                                                                                                                           ö
oligonuclectides are also useful for treating diabetes, obesity, cardiovascular disorders, hyperlipidaemia or Cushing's syndrome. The present DNA sequence represents an antisense oligonucleoride that targets the human glucocorticoid receptor gene. NOTE: The present sequence contains 2'-methoxyethyl (2'-MOE) wings and a phosphorothioate backbone.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New antisense compound targeted to a nucleic acid molecule encoding mammalian glucocorticoid receptor, useful for treating diabetes, obesity, cardiovascular disorder, hyperlipidemia or Cushing's syndrome.

The present invention relates to an antisense compound targeted to a nucleic acid molecule encoding Navl.3, where the antisense compound specifically hybridizes with and inhibits the expression of Navl.3. The compound and composition are useful for treating a disease or condition associated with Navl.3, e.g. pain including but not limited to neuropathy, trigeminal neuropathy, arthritic pain, lower back pain, diabetic neuropathy, trigeminal neuropathy, arthritic pain, acute pain, pain from burns, migraine headache, cluster headache, mild-to-moderate pain from burns, migraine headache, cluster headache, mild-to-moderate headache; seizure disorder such as childhood seizure disorder; including but not limited to neonatal or infantile epilepsy; or ataxia. The present sequence represents a chimeric phosphorothicate oligonucleotide with the annay and a decoxy gap. Used during the antisense inhibition of human Navl.3 expression, the oligonucleotides are designed to target
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New antisense compound targeted to a nucleic acid molecule encoding Nav1.3, useful for useful for treating a disease or condition associated with Nav1.3, e.g. pain, seizure disorder such as childhood seizure disorder, or ataxia.
                                                                                                                                                 Navl.3; Analgesic; Nootropic; Neuroprotective; post-herpetic neuralgia; diabetic neuropathy; arthritic pain; migraine headache; infantile epilepsy; ataxia; ss.

```
The present invention relates to an antisense compound targeted to a nucleic acid molecule encoding Nav1.3, where the antisense compound specifically hybridizes with and inhibits the expression of Nav1.3. The compound and composition are useful for treating a disease or condition associated with Nav1.3, e.g. pain including but not limited to neuropathic pain, post-herpetic neuralism, chronic pain, lower back pain, diabetic neuropathy, trigeninal neuropathy, arthritic pain, acute pain, pain from burns, migraine headache, cluster headache, mild-to-moderate headache; seizure disorder such as childhood seizure disorder, including but not limited to neonatal or infantile epilepsy; or ataxia. The present but not limited a chimeric phosphorothioate oligonucleotide with human Nav1.3 expression, the oligonucleotides inhibition of different regions of the human Nav1.3 RNA.
                                                                                                                                                                                                                                                                                                                                                                                                                           New antisense compound targeted to a nucleic acid molecule encoding Nav1.3, useful for useful for treating a disease or condition associated with Nav1.3, e.g. pain, seizure disorder such as childhood seizure
                                    Navl.3; Analgesic; Nootropic; Neuroprotective; post-herpetic neuralgia; diabetic neuropathy; arthritic pain; migraine headache; infantile epilepsy; ataxia; ss.
Chimeric phosphorothioate oligonucleotide to target Navl.3 #1701.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Seguence 20 BP; 0 A; 1 C; 1 G; 18 T; 0 U; 0 Other;

```

The present invention relates to a method (M1) for labeling double stranded nucleic acid for efficient detection of DNA or RNA. The method comprises using a carbodismide derivative for labeling one or more of thymine, uracil and guanine, which exists in the mismatch region of the double stranded nucleic acid or its vicinity, or unstable region of the hydrogen bond of the double stranded nucleic acid. (M1) is useful for labeling double stranded or single stranded nucleic acid or detecting single nucleotide polymorphisms. The present sequence was used to illustrate the method of the invention.

Labeling double stranded nucleic acid, involves utilizing carbodiimide derivative for labeling thymine, uracil and guanine, which exists in mismatch region of nucleic acid or unstable region of hydrogen bond of nucleic acid.

A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of labelled reverse transcription primers (GENESEQ files AAQ75547-075798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in separate lanes. The
                                      Analysis of cDNA and gene expression - by amplification of mRNA followed
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Analysis of cDNA and gene expression - by amplification of mRNA followed
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type clabelled reverse transcription primers (GENESEO files AAQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The
                                                                                                                                                                                                                                                           method can be used to analyse gene expression rapidly and easily
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   method can be used to analyse gene expression rapidly and easily

Analysis of cDNA and gene expression - by amplification of mRNA followed by digestion with restriction enzymes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        A method for the analysis of cDNA comprises (a) preparing an aggregate double-stranded cDNAs by using an aggregate of mRNAs and a plural type labelled reverse transcription primers (GENESEQ files AAQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

                                                                                                                                                                                                                                                                                                                                                       A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of labelled reverse transcription primers (GENESEQ files AAQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                                                                                                                                                                                                                             - by amplification of mRNA followed
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

               alysis of cDNA and gene expression - by amplification of mRNA followed digestion with restriction enzymes.
                                                                                              A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type olabelled reverse transcription primers (GBNESEQ files AAQ75547-075798) and using the aggregate of mNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Analysis of cDNA and gene expression - by amplification of mRNA followed by digestion with restriction enzymes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       double-stranded cDNAs by using an aggregate of mRNAs and a plural type of labelled reverse transcription primers (GENESGO files AAQ75547-075798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           preparing an aggregate

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  당당
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Analysis of cDNA and gene expression - by amplification of mRNA followed by digestion with restriction enzymes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of ababled reverse transcription primers (GENESEQ files AAQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

Analysis of cDNA and gene expression - by amplification of mRNA followed by digestion with restriction enzymes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type clabelled reverse transcription primers (GENESEQ files AAQ75547-075798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

                                                                                                                                                                A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of labelled reverse transcription primers (GENESEQ files AAQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       of
of
Analysis of cDNA and gene expression - by amplification of mRNA followed by digestion with restriction enzymes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Analysis of cDNA and gene expression - by amplification of mRNA followed
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            A method for the analysis of cDNA comprises (a) preparing an aggregate double-stranded cDNAs by using an aggregate of mRNAs and a plural type labelled reverse transcription primers (GRNESEQ files AAQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           seperate lanes. Analysis of cDNA and gene expression - by amplification of mRNA followed by digestion with restriction enzymes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of labelled reverse transcription primers (GENESEQ files AAQ75547-075798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Analysis of cDNA and gene expression - by amplification of mRNA followed
                                                                                                                                                                                       Analysis of cDNA and gene expression - by amplification of mRNA followed by digestion with restriction enzymes.
                                                                                                                                                                                                                                      A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNNs by using an aggregate of mRNAs and a plural type of ababelled reverse transcription primers (GENESEQ files AAQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                                                                                                                                                                                                                                                                                                  Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            A method for the analysis of CDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of labelled reverse transcription primers (GENESEQ files AAQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                                                A method for the analysis of cDNA comprises (a) preparing an aggregate c double-stranded cDNAs by using an aggregate of mRNAs and a plural type c labelled reverse transcription primers (GENESEQ files AAQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gape

```

요

```
Analysis of cDNA and gene expression - by amplification of mRNA followed by digestion with restriction enzymes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ss; hybridisation; capture oligonucleotide; pattern; mucosal; hair root; blood; nerve; germ cell; food additive; food supplement.
                                                                                                                                                                                                                                                                                   double-stranded cDNAs by using an aggregate of mRNAs and a plural type of labelled reverse transcription primers (GENESEQ files AAQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                                                                                                                                                                                                  A method for the analysis of cDNA comprises (a) preparing an aggregate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sorting single-stranded nucleic acid, useful for analyzing expression patterns and screening active agents, uses capture agent with variable and constant regions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                          0.7%; Score 18; DB 1; Length 21;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type o labelled reverse transcription primers (GENESEQ files AAQ75547075798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

Sorting single-stranded nucleic acid, useful for analyzing expression patterns and screening active agents, uses capture agent with variable and constant regions.

Example; Page 5; 8pp; German.

This invention describes a novel method for sorting single-stranded racids by isolation and hybridisation of nucleic acid pools, then reading out, where the nucleic acids are selectively bound using capture agents that are (a) immobilised on the surface of a solid matrix and (b) comprise variable and non-variable regions. The capture oligonucleotides have a 5'-invariable enchor region, the complement of which is present at that comprises all possible combinations of up to 10 nucleotides to allow that comprises are particularly locked nucleic acids (LNA) and the anchor region comprises as sequence of 10-50, particularly 15-25, T residues. The capture agents are particularly locked nucleic acids (LNA) and the anchor region comprises a sequence of 10-50, particularly 15-25, T residues. The capture comprises a sequence of 10-50, particularly 15-25, T residues by interaction with streptavidin. The matrix is of plastic, caramic, glass, metal, resin, gel, crystalline material and/or membrane, having semiconducting properties and especially in the form of a chip. Its surface is particularly a layer of (bio)molecular filaments and binding of single stranded nucleic acids to the surface is (quasi) covalent, supramolecular, physical, stimulated by an electrical field or through a molecular sieve. The method is used (i) for analysis of patterns, especially in mucosal, hair root, blood, nerve or germ cells and (ii) for determining the activity of pharmaceuticals and/or nutritional compounds, e.g. food mixtures. The method provides rapid inexpensive and reproducible conductines. The method provides rapid inexpensive and reproducible conductines or supplements, especially minerals, race elements, organic acids (amino, carboxylic or fatty acid) or their derivatives, salts and matrix anging of the complete pattern of all nucleic acid sol in a cell, and one is based on comparison of uniterication of unitered acid in a cell, and one and enchance matrix miniaturism in an enchance in the nucleic acid conduction is nonembrane. genes, matrix miniaturisation is possible. ADK01281-ADK01344 represent capture probes used in the method of the invention.

Sorting single-stranded nucleic acid, useful for analyzing expression patterns and screening active agents, uses capture agent with variable and constant regions.

Example; Page 5; 8pp; German.

This invention describes a novel method for sorting single-stranded cucleic acids by isolation and hybridisation of nucleic acids pools, then reading out, where the nucleic acids are selectively bound using capture reading out, where the nucleic acids are selectively bound using capture agents that are (a) immobilised on the surface of a solid matrix and (b) comprises variable and non-variable regions. The capture oligonucleotides have a 5-invariable anchor region, the complement of which is present at least once in each nucleic acid and a 3-variable, discriminatory region that comprises a sequence of solid solid stranded nucleic acids. The capture agents are particularly locked nucleic acids (LNA) and the anchor region comprises a sequence of 10-50, particularly 15-25, Tresidues The capture of capture oligonuclectides are biotinylated and immobilised on a surface by interaction with streptavidin. The matrix is of plastic, ceramic, glass, capture oligonuclectides are biotinylated and immobilised on a surface by interaction with streptavidin. The matrix is of plastic, ceramic, glass, conducting properties and especially in the form of a chip. Its surface is particularly a layer of (bio)molecular filaments and binding of single conducting properties and especially in the form of a chip. Its surface is particularly a layer of (bio)molecular filaments and binding of single conducting properties and electrical field or through a molecular sieve. The method is used (i) for analysis of patterns, especially in mucosal, cativity of pharmaceuticals and/or nutritional compounds, especial, and additives or supplements, especially minerals, trace elements, organic acids (amino, carboxylic or fatty acid) or their derivatives, salts and elect very small differences in pools of nucleic acids from cells and comparison of allows inaspensal and reproducible. Since the can detect very small differences in the method spools, not individual center probes used in the method of the invention. This invention describes a novel method for sorting single-stranded

Hoppe H;

Sorting single-stranded nucleic acid, useful for analyzing expression patterns and screening active agents, uses capture agent with variable

This invertion describes a movet method for sorting single-stranded nucleic acids by isolation and hybridisation of nucleic acid pools, then reading out, where the nucleic acids are selectively bound using capture agence that are (a) immobilised on the surface of a solid matrix and (b) comprise variable and non-variable regions. The capture oligonuclectides have a 5'-invariable anchor region, the complement of which is present at certain act nucleic acid and a 3'-variable, discriminatory region that comprises all possible combinations of up to 10 nucleotides to allow binding of particularly locked nucleic acids (LMA) and the anchor region comprises a sequence of 10-50, particularly 15-25, Tresidues. The capture oligonucleotides are biotinylated and immobilised on a surface by interaction with streptavidin. The matrix is of plastic, ceramic, glass, conducting properties and especially in the form of a chip. Its surface is particularly a layer of (bio)molecular filaments and binding of single stranded nucleic acids to the surface is (quasi) conducting propertied by an electrical field or through a molecular, physical, stimulated by an electrical field or through a molecular, physical, stimulated by an electrical field or through a molecular, conducting broot, blood, nerve or germ cells and (ii) for date matrix is of for a crivity of pharmaceuticals and/or nutritional compounds, e.g. food additives or supplements, especially minerals, trace elements, organic crids and analysis of patterns, state and reproducible.

Conducting of the complete pattern of all nucleic acids from cells and callows imaging of the complete pattern of all nucleic acids from cell, and can lows imaging of the complete pattern of all nucleic acid pool: Since the method is based on comparison of nucleic acid pool: Since the can method is based on subplements appears the method is possible. The method is possible and the propertion of patterns and pools of the analysis of the analy genes, matrix miniaturisation is possible. ADK01281-ADK01344 represent capture probes used in the method of the invention. This invention describes a novel method for sorting single-stranded

Sorting single-stranded nucleic acid, useful for analyzing expression patterns and screening active agents, uses capture agent with variable and constant regions. WPI; 2003-714082/68.

Example; Page 5; 8pp; German.

This invention describes a novel method for sorting single-stranded nucleic acids by isolation and hybridisation of nucleic acid pools, then reading out, where the nucleic acids are selectively bound using capture agents that are (a) immobilised on the surface of a solid matrix and (b) comprise variable and non-variable regions. The capture oligonuclectides have a 5'-invariable anchor region, the complement of which is present at cleast once in each nucleic acid and a 3'-variable, discriminatory region that comprises all possible combinations of up to 10 nuclectides to allow binding of particulars sorts of single stranded nucleic acids. The capture comprises as sequence of 10-50, particularly 15-25, T residues. The capture comprises a sequence of 10-50, particularly 15-25, T residues. The capture oligonuclectides are biotinylated and immobilised on a surface by interaction with streptavidin. The matrix is of plastic, ceramic, glass, metal, resin, gel, crystalline material and/or membrane, having semi-conducting properties and especially in the form of a chip. Its surface is particularly a layer of (bio) molecular filaments and binding of single stranded nucleic acids to the surface is (quasi) covalent, supramolecular, physical, stimulated by an electrical field or through a molecular, physical, stimulated by an electrical field or through a molecular, cativity of pharmaceuticals and/or nutritional compounds, e.g. food additives or supplements, especially minerals, trace elements, organic crimistroot, blood, nerve or germ cells and (ii) for determining the activity of pharmaceuticals and/or nutritional compounds, e.g. food additives or supplements, especially minerals, trace elements, organic caids (amino, carboxylic or fatty acid) or their derivatives, salts and mixtures. The method provides rapid, inexpensive and reproducible

Compound of differences in pools of nucleic acid pool, since the method is based on comparison of nucleic acid pools, not individual canning and in the method is the physical in the nucl capture probes used in the method of the invention.

Pharmaceutical composition for treating asthma, has antisense oligonuclectide containing less percentage of adenosine, targeted to nucleic acids associated with lung airway or lung dysfunction, and bronchodilating agent.

Claim 15; SEQ ID NO 4945; 763pp; English.

This invention describes a novel composition (a) a first active agent, comprising oligonucleotides, effective for alleviating bronchoconscriction, respiratory tract inflammation, allergies and reducing adenosine sensitivity, levels of adenosine (A) receptors, confidenceonscriction, respiratory tract inflammation, allergies and reducing adenosine sensitivity, levels of adenosine (A) receptors, coligonucleotides are derived from a gene encoding or regulating expression of a target polypeptide associated with lung airway or lung expression of a target polypeptide associated with lung airway or lung expression of a target polypeptide associated with lung airway or lung evice, in separate containers, (b) the oligonucleotides, (c) instructions for adding a carrier and for use of the kit. The composition of the invention has antiallargic, antialfalmmatory, antiaethmatic, analgesic, hypotensive, immunosuppressive and cytostatic activity, is a beta-adrenergic agonist. The composition is useful for preventing or treating a respiratory, lung or malignant disease. The administered composition comprises oligo and is administered to reduce the production or availability, or to increase the degradation of the target mRNA or to reduce the amount of target polypeptide present in the lungs. The pulmonary obstruction, and/or bronchoconstriction and/or lung inflammation, allergies and/or bronchoconstriction and/or lung inflammation, allergies as thma, impeded respiration, respiratory distress syndrome, path, cystic fibrosis, allergic rhinitis, pulmonary transplantation rejection, pulmonary infections, bronchit the breakced, the reduced adenosine content of the anti-sense oligos corresponding to the reduced adenosine content of the anti-sense oligos-corresponding to the oligonucleotides into products that fare adenosine into the system engine or in the target that fare adenosine into the system engine or in the target that fare adenosine or the edgradation and products that fare adenosine content of the edgradation benchman and the

The invention relates to a class of CpG immunostimulatory
oligonuclectides containing a 5'TCG motif or a CG at or the 5' end that
coligonuclectides containing an immune response. Oligonuclectides and
compositions of the invention are useful for treating allergy or asthma,
viral and bacterial infections and cancer e.g. biliary tract cancer,
breast cancer, cervical cancer, choriocarcinoma, colon cancer,
endometrial cancer, gastric cancer, lymphomas, intraepithelial melanoma,
liver cancer, lung cancer (e.g. small cell and non-small cell), melanoma,
curoblastomas, ovarian cancer, pancreatic cancer, brostate cancer,
rectal cancer, sarcomas, thyroid cancer, renal cancer, bone cancer,
cetal cancer, sarcomas, thyroid cancer, renal cancer, brain
and CNS cancer, connective tissue cancer, oseophageal cancer, brain
Hodgkin's lymphoma, larynx cancer, oral cavity cancer, skin cancer,
ceticular cancer, as well as other carcinomas and sarcomas. The
cincention is also useful in gene therapy. The present sequence is a CpG
immunostimulatory oligonucleotide.
                                                                                                                                                                                                                                                                            CpG immunostimulatory oligonucleotide; immune response; allergy; asthma;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 viral and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to an ICAM-1 binding protein, and a polynucleotide encoding the same, a vector and a host cell containing the same polynucleotide, and a composition comprising the same protein are provided. The ICAM-1 binding protein has high specificity to ICAM-1 and small molecular size, so that it can be effectively expressed in Bacherichia coli. and the composition containing the ICAM-1 binding protein has improved stability and excellent tissue penetration, so that it can be useful for the treatment of inflammation. The present sequence represents a mouse ICAM-1 binding protein associated PCR primer.
                                                                                                                                                                                                                                                                                                                                          ICAM-1 binding protein, and polynucleotide encoding the same, vector and host cell containing the same polynucleotide, and composition comprising

This sequence is an example of a 2-5A-antisense oligonucleotide chimeric molecule. The antisense region targets the chimeric molecule to a particular region of RNA to be specifically cleaved and the 2',5'-linked tetraadenylate tail activates the 2-5A RNase. Typical applications are treatment of viral infections (esp. for cleavage of an RNA virus genome), cancer, leukaemia, cardiovascular disorders (e.g. restenosis after angioplasty), genetic disorders, osteoarthritis or rheumatoid arthritis. (Updated on 25-WAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       opecific cleavage of RNA, useful partic. for treating viral infection, cancers, etc. - by using anti-sense oligo:nucleotide coupled to activator of 2-5A dependent RNase.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Analysis of cDNA and gene expression - by amplification of mRNA followed by digestion with restriction enzymes.
                                                                               double-stranded cDNAs by using an aggregate of mRNAs and a plural type of labelled reverse transcription primers (GENESEQ files AAQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type (labelled reverse transcription primers (GENESEO files AAQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The
                                                       A method for the analysis of cDNA comprises (a) preparing an aggregate
                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             method can be used to analyse gene expression rapidly and easily
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Analysis; gene expression; reverse transcription; primer; cDNA;

gene expression - by amplification of mRNA followed
                                                                                                                                               gene expression - by amplification of mRNA followed
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of labelled reverse transcription primers (GENESEQ files AAQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                                                                                                                                                                            A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of abelled reverse transcription primers (GENSESD files AAQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        expression; reverse transcription; primer; cDNA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Reverse transcription primer used in cDNA analysis technique.
                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence 21 BP; 0 A; 1 C; 2 G; 18 T; 0 U; 0 Other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of labelled reverse transcription primers (GENESEQ files AAQ75547-075798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            - by amplification of mRNA followed

                                                                                                                                                                                                                                                                                                                                                                                                                                                     A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of labelled reverse transcription primers (GENESEQ files AAQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                                                                                                                                                                                                                                                                                                                                      Analysis of cDNA and gene expression - by amplification of mRNA followed by digestion with restriction enzymes.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Analysis of cDNA and gene expression - by amplification of mRNA followed by digestion with restriction enzymes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of labelled reverse transcription primers (GENESEQ files AAQ75547-075798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              93JP-00112515
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         7
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              04-AUG-1995 (first entry)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     AAQ75739 standard; DNA;
```

```
A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of labelled reverse transcription primers (GBNESEQ files AAQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Analysis of cDNA and gene expression - by amplification of mRNA followed
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       method can be used to analyse gene expression rapidly and easily
                                                                                                                                                                                                                         Analysis, gene expression, reverse transcription, primer, cDNA, aggregate, restriction enzyme, ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Analysis; gene expression; reverse transcription; primer; cDNA;
                                                                                                                                                                               Reverse transcription primer used in cDNA analysis technique.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Reverse transcription primer used in cDNA analysis technique
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           0.6%; Score 17.8; DB 1; Length 21; 90.5%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       amplification of mRNA followed
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type clabelled reverse transcription primers (GENESEQ files AAQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded CDNAs with restriction enzyme and; (c) electrophoresing the digesting aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                   A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of labelled reverse transcription primers (GENESEQ files AAQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                   Gaps

A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of labelled reverse transcription primers (GENESEQ files AAQ75547-075798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                                                       Analysis of cDNA and gene expression - by amplification of mRNA followed by digestion with restriction enzymes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    amplification of mRNA followed
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of labelled reverse transcription primers (GENESEQ files AAQ75547-075798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Analysis; gene expression; reverse transcription; primer; cDNA; aggregate; restriction enzyme; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Analysis of cDNA and gene expression - by amplification of mRNA followed by digestion with restriction enzymes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type clabeled reverse transcription primers (GENESEQ files AAQ75547-075798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Analysis of cDNA and gene expression - by amplification of mRNA followed by digestion with restriction enzymes.
                                                                                                                                                                amplification of mRNA followed
                                                                                                                                                                                                               A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of abelled reverse transcription primers (GENESEQ files AAQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded CDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                                                                                                                                                                                                                                                                              Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              - by amplification of mRNA followed
A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of ababiled reverse transcription primers (GENESEQ files AAQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     elections of the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                A method for the analysis of cDNA comprises (a) preparing an aggregate double-stranded cDNAs by using an aggregate of mRNAs and a plural type labelled reverse transcription primers (GBNESEQ files AAQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate in the

of of

- by amplification of mRNA followed

```
A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of labelled reverse transcription primers (GENESEQ files AAQ75547075798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                                                                                                                                                                                Sequence 21 BP; 0 A; 1 C; 2 G; 18 T; 0 U; 0 Other;

                                                                                                                                                                                                                                                                                                                                                                                          A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of labelled reverse transcription primers (GENESEQ files AAQ75547-075798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Analysis of cDNA and gene expression - by amplification of mRNA followed by digestion with restriction enzymes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of ababled reverse transcription primers (GENESEQ files AAQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Analysis; gene expression; reverse transcription; primer; cDNA; aggregate; restriction enzyme; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                 A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of labelled reverse transcription primers (GENESEQ files AAQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                                                                                                                                                                                                                                                                                                                Analysis of cDNA and gene expression - by amplification of mRNA followed by digestion with restriction enzymes.

Analysis of cDNA and gene expression - by amplification of mRNA followed
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Analysis of cDNA and gene expression - by amplification of mRNA followed by digestion with restriction enzymes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of ababiled reverse transcription primers (GENESEQ files AAQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 .
